Dubai, UAE | +971569538533 | s.holi_1989@live.com | [LinkedIn](#) | [Portfolio](#)

Open to Remote Roles | Available Across All Time Zones | English: Professional Working Proficiency

PROFESSIONAL SUMMARY

Hands-on quality engineer with 11+ years in software quality across payments, aviation and healthcare. Finds product and customer risks early with Product, Engineering and Design, through exploratory testing, production data and risk-based planning. Builds web, mobile and API automation with Playwright (TypeScript), Selenium and Appium, and reads and debugs application code to get to root cause. Four years fully remote across time zones.

CORE SKILLS

Testing: Exploratory, risk-based, API and integration, contract testing (OpenAPI/Swagger, PactFlow), real-device mobile testing (SauceLabs).

Programming: Java (primary); TypeScript and JavaScript/Node.js.

Observability: Splunk.

Leadership: Distributed team leadership, SaaS vendor QA governance, release readiness, quality gates and SLAs, RFI/RFT/SOW review.

Automation: Playwright (TypeScript), Selenium, Appium, RestAssured, Cucumber, JUnit, TestNG, hybrid web/API automation frameworks.

CI/CD: GitLab CI, Jenkins, Maven, Git.

Tools: Jira, QMetry, TestRail, Confluence, Agile/Scrum delivery.

GenAI for QA: Claude, GitHub Copilot and Playwright agents for test-case generation, synthetic test data, automation authoring and AI-assisted test analysis.

PROFESSIONAL EXPERIENCE

Quality Assurance Lead - dnata International

Emirates Group, Dubai

Jan 2026 - Present

Lead QA for enterprise airport platforms used across Europe, the Middle East and Asia. Hands-on in testing and automation while leading internal engineers and the vendor's QA delivery.

- Worked directly with the Product Owner, Project and Delivery Managers and business teams on the dnata side, and with the vendor's development and test teams, from requirements through release.
- Built a Playwright (TypeScript) framework for web and API integration testing of an enterprise asset management (EAM) product live in Switzerland and Italy, with more airports and stations to follow: about 600 end-to-end scenarios written with Playwright agents and AI-assisted authoring, running in GitLab CI after moving execution from Jenkins to GitLab CI with SauceLabs.
- Redesigned the Selenium and Appium framework for a food safety (HACCP) catering application on a new architecture, cutting the regression run from 8h to about 3h, with mobile suites on real Samsung devices in GitLab and Jenkins pipelines.
- Reviewed the vendor's infrastructure design for testability and resilience, and raised a risk to performance test accuracy that led the vendor to change the design.
- Added contract and schema tests for program APIs with RestAssured against OpenAPI/Swagger specs, supported by PactFlow.
- Built an IATA 792 barcode generator and decoder, unprompted, that creates synthetic boarding data, so lower environments hold no passenger PII and automation has repeatable test data.
- Proposed and added failure categorization to the Allure reports, so each run shows clear error categories and failures are triaged faster.

- Used Splunk logs to reproduce bugs and to build automation test data with PII removed.
- Traced test and pipeline failures to root cause across the application, APIs and GitLab CI before raising them with developers.
- Used Claude, GitHub Copilot, Playwright agents and Emirates' internal AI tool (Aurora) for test cases, synthetic test data and first drafts of automation scripts, cutting manual documentation work.
- Governed vendor QA delivery: reviewed RFI, RFT and SOW responses, ran technical evaluations, sat on QA interview panels, and defined the SLAs and quality gates the vendor delivers against.
- Owned release readiness for each release, and traveled to lounges in Europe and Africa to run on-site UAT of the Lounge Management System (LMS) with business, product and vendor teams before a production rollout with no issues.

Lead Quality Assurance Engineer

Emirates Group, Dubai

Jan 2024 - Jan 2026

Led QA for core Emirates passenger-service and payment platforms across web, mobile and API layers.

- Worked in sprints with the Product Owner, Scrum Master, designers and in-house developers as the embedded QA for the team.
- On my own initiative, used production data during the payment gateway migration to check which cards customers really use, found one that would have failed on the new version, and proposed a routing fix that kept the release on its planned date.
- Planned test coverage for the migration by risk, so critical payment cases were covered first and the remaining effort went to the scenarios that mattered most to customers.
- Found a payment failure when switching payment method mid-entry through exploratory testing, affecting web, mobile and call center users. Caught before release.
- Raised UX risks, missing test cards and untested flows early in the same release, and worked with designers on payment gateway UI changes that made the flow easier for end users.
- Built UI automation (Selenium, Cucumber) and API and contract tests (RestAssured, Cucumber, OpenAPI/Swagger) for the migration from XML to JSON services across global and local card types, on a gateway that processes millions of transactions.
- Extended the existing Selenium framework, ran web and mobile suites on SauceLabs through Jenkins, and wrote JUnit unit tests inside the framework.
- Debugged failures across the application, APIs and CI pipelines to root cause before raising them with developers.
- Led end-to-end QA for Emirates Resconnect (Reservations, Ticketing, Check-In): test plans, functional, integration and regression testing across web, mobile and middleware.
- Ran UAT with business teams, with training sessions and walkthroughs so operations were ready for each release.
- Refined acceptance criteria with the Product Owner and joined sprint planning with the Scrum Master and Project Manager.

Senior QA Engineer

IQVIA, Palestine - Remote

Sep 2021 - Jan 2024

Led QA for IQVIA's healthcare SaaS suite serving providers, payers and patients across the Middle East and parts of Europe, coordinating 8 engineers across time zones and 8 interconnected products.

- Worked with in-house developers and Product across the 8-product program, from design discussions through release.
- Defined release readiness criteria, shift-left QA strategy and test plans across the 8-product program, and ran test execution and defect triage across distributed teams.
- Coordinated UAT, demos and release sign-off with Product and operations teams, tracking QA KPIs and defect trends.

- Reached 90% requirements coverage across the suite, tracked through a requirements traceability matrix in Jira, supporting the multi-country rollout across the Middle East and Europe.
- Designed a modular automation architecture for microservices platforms, cutting execution time from 8h to 4h.
- Debugged automation and application failures to root cause and ran root-cause analysis with developers.
- Wrote automation with Selenium WebDriver, RestAssured and TestNG, with YAML-based configuration.
- Ran JMeter tests on healthcare backend APIs and took part in performance reviews and decisions with cross-functional teams.
- Joined architecture discussions on serverless solutions to align the test strategy with the design.
- Built quality dashboards and automated shift-left test gates tracking defect density, coverage, pass rate and release readiness.

QA Engineer

ProGineer Technologies, Palestine - Remote

Nov 2019 - Sep 2021

ProGineer Technologies is a Palestine-based company serving as a delivery partner to PDF Solutions, Inc. (Santa Clara, CA).

- Implemented and maintained the Quality Assurance plan across product releases.
- Performed manual testing for desktop applications and APIs, and reported and tracked defects in Jira.
- Built Java tools for the QA team, including an automated deployment tool and a utility that updates thousands of XML files to match changing requirements.
- Executed backend database validation for enterprise web platforms.
- Standardized QA documentation, templates and workflows, and mentored engineers.

Systems Integration Engineer

Ooredoo (Wataniya Mobile Palestine), Palestine

May 2015 - Nov 2019

Developed, monitored and operated integration systems within an SOA environment.

- Analyzed, designed, tested, debugged and documented integration flows and services in SOA Suite.
- Ran end-to-end, regression, functional and API testing across telecom platforms.
- Set up a daily cron job that scanned production database logs, flagged issues and emailed a report to the team.
- Upgraded and automated reconciliation routines, reducing manual effort by 40% and removing recurring data errors.
- Automated daily reporting of transaction failures, API performance and errors.
- Investigated incidents and ran root-cause analysis with cross-functional teams.

EDUCATION & CERTIFICATIONS

Certified Ethical Hacker (CEH) - EC-Council

Arab German Academy, one-year hands-on course followed by the certification exam

2015 - 2016

BSc Telecommunication Engineering

An-Najah National University

2010 - 2015
